Large experimental datasets like the Inorganic Crystal Structure Database (ICSD) contain hundreds of thousands of entries but are not diverse enough, as they contain only composition and structure of the materials. The diverse datasets like Landolt-Börnstein ( <http://materials.springer.com/>) or AtomWorks ( [http://crystdb.nims.go.jp/index\\_en.html](http://crystdb.nims.go.jp/index_en.html)) contain hundreds to thousands of entries for different properties, so they are not large enough for training modern machine learning algorithms.
